The Raven's Progressive Matrices, or RPM, is a non-verbal test commonly used to measure general human intelligence and abstract thinking, and is regarded as . It was developed in 1912 and has been used ever since to measure general human intelligence. It is also used to measure the intellectual factor and to determine mental health. The RPM matrix was developed in 1912 by William Raven to measure intelligence in a broad sense. Although it can be seen as a test for

Allogeneic stem cell transplantation for severe hemophagocytic lymphohistiocytosis: an international retrospective study of outcomes for more than 200 patients in 14 centers. We sought to evaluate the efficacy, safety, and outcome of allogeneic stem cell transplantation (SCT) in hemophagocytic lymphohistiocytosis (HLH). We conducted an international multicenter retrospective study of 116 adult patients with HLH who received transplantation in 14 transplant centers between 1994 and 2010. The median age at transplantation was 34 years (range, 15 to 58 years). Conditioning regimens consisted mainly of total body irradiation with a reduced intensity (18-45 Gy) or with an intermediate-dose TBI regimen (8-20 Gy), and 6-8 months of immunosuppressive therapy after transplantation. The median follow-up was 4 years (range, 0 to 13 years). At 3 years, cumulative incidence of relapse was 43% (95% confidence interval [CI], 36% to 50%). Six patients (5%) were alive in complete c6a93da74d
