russian journal of general chemistry is a peer reviewed journal. we use a single blind peer review format. the average period from submission to first decision is 14 days. the average rejection rate for submitted manuscripts is 35%. the final decision on the acceptance of an article for publication is made by the editor-in-chief. inorganic halides of metals such as sodium, potassium and magnesium have been used as catalysts for obtaining high-quality polymers. the efficient polymerization is believed to be due to the formation of a high surface area catalytic nanoparticle. to enhance the catalytic performance of these nanoparticles, it is common to incorporate the catalyst nanoparticles inside the polymeric matrix. the most common method used to incorporate the nanoparticles is the addition of the catalytic nanocatalysts into the polymer matrix during the melt mixing process. the particle size distribution of the metal halide nanoparticles is very important, as it affects the performance of the catalytic material. nanoparticles with a small particle size distribution are preferably selected for the preparation of composite nanocatalysts. the molecular and structural properties of the organic-inorganic hybrids are explored and discussed in this review. the main focus of the review is to emphasize the synthesis and characterization of hybrids and their applications. a detailed discussion of the complex formation mechanism of these hybrids and the various post-synthesis processes is included.

K Kumar Inorganic Chemistry Pdf 179
