The entire collection of sharpening tools become much smarter. Lightroom's Sharpen tool, can now perform multiple sharpening operations on an image; it also has a new sharpening mode, Smart Sharpen. It sharpens in a much faster, more intuitive way with a lot more control than before. The adjustments made to the sharpening process are completely customizable along with the type of targets (or your whitepoint) you will use for your sharpening. We'll save the special effects and titillations for when we're in the mood - those are best seen real-time, in-camera, instead of in Photoshop. Some of the other elements can be seen in action above. Adobe is touting the "AI" feature more than ever - it's easy to see the effort put into trying to teach Photoshop what the face is, where the eye and mouth are, and even how to show a smile. There's another new trick in Adobe's current suite of features: a dedicated Exposure app on its own. You can say that the company's long-term vision is for a photo editing kit as a single solution, but Adobe still has a handful of apps like this, and you don't always need them all. You can opt your photos out of the Exposure feature entirely, of course, and after a while, it'll stop presenting you with that message. Don't worry - you still won't have to look for your photos in Adobe Lightroom any less than before. The new Catalog app's full-featured editing tool means that Adobe has managed to keep its multitouch-based tools in the same place, and make them all work better together. It grants you unprecedented levels of control over the look of your photos, while still allowing you to keep significant parts of your workflow simple -- like a rotoscope, for instance -- and unchanging. For instance, choose a clip frame for your final output, or create frame grabs of a video. You can preview them, select frames, and keep scrolling through the clip without having to save any changes; then, when you're ready, we'll be able to export all the frames to your movie, or operate on them one by one during export. In pretty much any other app, you'd have to delete the frame captures and redo your export operation...but not in the new optical-flow-based production suite. Which is great news for people like me who are not exactly speedy.

With Adobe's innovative Sensei in use, users can be more productive with artificial intelligence-based features across a variety of industries. The new versions of Photoshop desktop apply the latest AI advancements together with a roster of breakthrough features including intelligent selection enhancements, intelligent art board detection, smarter workspace content recommendations, and more. The use of artificial intelligence allows the software to help users find the best tools and apply those tools to images. Learning software allows users to train the software to recognize what they create during normal use. Further, users can apply the training to an image that they are not working on or design work that they have not done before. This type of work can be challenging for the human eye, so software breaks down the large photo into smaller views and gives users the ability to preview what the overall image will look like. The tool can also be used to pick and choose where the software will focus the user's attention. When working on multiple images at once, it can be hard to keep a timeline of edits and implement them to the other images. This new addition to Photoshop will let users tag images in groups making the timeline easier to review and apply to the images. This is very similar to copy and paste, but it can be more tailored to what users are trying to accomplish when editing different images. It can make large batches of editing much too easy.
