2014 – Adobe Lightroom is a great program for working with photos, and I love it. I used to use Nik's raw converter, and it really, really sucked. But I just switched to Lightroom, and it works so much better. It gets things right, while at the same time, remaining edgy. The thumbnails I get via Adobe Bridge make it easy and quick to see first, so I can click on them and open them in Lightroom right up. It's also great to be able to share photos directly to Facebook and other services while editing. And even without a smartphone, I can take a photo or view an image on a card and send it to myself without any problems. There's some useful new features in the Sharing panel. It's now possible to toggle between editing and reviewing modes for any selected image. You can even augment a non-Photoshop browser visit, viewing a JPEG or PDF snapshot of your original edit. You'll still need to export a file to a full resolution format for non-Photoshop browsers, however, so even at the 140-megabit lossless JPEG level, the conversion will still introduce some minor artifacts. If you enable the link to the Photoshop Help page, you can access the extensive list of all Photoshop features online, and even scroll down to the bottom to find features from any version. It works great any time you need additional help. The Document Browser shows you a list of the documents you have open. When you select a document, you can compare it with other versions in your history. It's not as slick as the Image Browser from CS3, but it does list changes by date and revision.

The more RAM that you can afford the better because the more RAM you have in your machine, the greater the desktop rendering speed. It is like the more you have, the more textures that it puts in your RAM cache, and the more they, again, put in your personal cache space. With more RAM loaded on your machine the more the software can cache the graphics that are being rendered and be able to access those graphics on your file, so over time, the more RAM you have, the faster you can render and access that cache. With the advancement in RAM DRAM, we are already entering into a new era of graphics-magnetic RAM, which will help to enhance the benefits it can provide to us, but this when it is available on a wider scale, not now. I agree with the RAM has huge benefits, but so does a powerful PSU (power supply). Make sure to research the speed of your PSU as well. As powerful as your RAM is, the lower the speed, the less speed your RAM is, the slower it will operate. I remember working with a customer who had a laser printer at the time. I was testing how well the printer's toner would handle out of the box and their printer wasn't too old, but it was a manual model with a toner cartridge. They knew they had daylight better than me because they printed daily and they handed me a toner cartridge in full. I opened it and began to install it, but that just didn't seem right so I kept that toner cartridge in the printer to see if there would be anything wrong.
